Automatic Number Plate Recognition

Data Sheet- ANPR

ANPR (Automatic number plate recognition) is a highly versatile security and access control solution, capable of being deployed as a permanent or temporary installation.

A specialist camera controls the scene, and only allows the exact required amount of illumination to pass into the camera, this ensures reliable number plate capture in both day and night conditions.

The benefits of the ANPR Parking Application-

- Car park control and management using automatic license plate recognition.
- Access control to authorized users at staff car parks and sensitive sites
- Maintains current and historical records of vehicles on site.
- Improved security for both car park operators and car park users.
- Flexible Access Control to easily accommodate visitors and delivery vehicles.
- Elimination of swipe cards or proximity devices and removes the need for car parking tickets in some public parking facilities.
- No driver co-operation or vehicle modification and can improve traffic flow during peak periods.

Applications-

ANPR can operate as a stand alone system in conjunction with our CCTV Digital Recorders, reliably capturing and recording vehicle number plates.

Using the ANPR Controller and software, you can also open automated gates and barriers automatically, as an authorized vehicle registered on the data base approaches. This requires no action from the driver of the vehicle.

The Database also features sophisticated search software enabling you to find out what vehicles are currently on site, when a vehicle was last on site, how long it was on site, and many other features which make it a truly versatile management tool.
