Electronic Detection Fence

Data Sheet EL1

A unique range of high end decorative security fencing products designed to provide protection at the perimeter of sites where a pleasing appearance combined with the highest security are of primary importance.

A covert system which uses its unique post mounted electronic processor to convert the signals from its sensor units at post level, communicating digitally with a control panel when an alarm condition is detected. The micro processor computes any change in the sensing device and when the time of change exceeds a set threshold, such as during an intrusion or an attempt to cut the fencing an alarm signal will be generated.

The system can be integrated into an Alarm panel or the Computerised Control system offering the possibility of Decorative Security fencing in public areas of the protected property whilst monitoring more proactive systems such as electric fencing in remote areas of the estate via the same control system.

Providing activation of lights, Sirens, Pager and associated security systems.

Proven track record at Airports, Diplomatic and Government properties, VIP and Celebrity Houses, with a practically zero false alarm rate, operating equally well in all weather conditions. System is not affected by Trees and Bushes or by grass growing in proximity to the fence.
