Wall & Roof Detection

Data Sheet- WD1

The Paramount Wall and Roof detector is a unique security system which is used to protect against intruders who attempt climbing on a concrete or wooden wall or roof.

The detector can be configured to operate with different types of surface, allowing for smooth or dappled finishes in most RAL colours. The addition of air vents to a smooth surface make the solution completely undetectable to the eye.

The detector will monitor the surface and edges of protected area, and will operate if a ladder is leant against the surface or if some stands or applies weight to the flat area of the detector.

The detector has a high immunity to false alarms, and is unaffected by rain, hail, snow or wind.

The Analyzer is fully integrated with our Electric, Electronic and Taut Wire solutions operating on the same data network; or to existing Intruder alarm systems.

Optional local outputs at the wall or roof are available to operate local lighting or warning devices.
